

THE

Wheat

SITUATION

BUREAU OF AGRICULTURAL ECONOMICS
UNITED STATES DEPARTMENT OF AGRICULTURE

WS-53

MARCH 1941

THIS ISSUE HAS BEEN PREPARED WITH PARTICULAR REFERENCE TO THE REPORT OF THE CROP REPORTING BOARD ON PROSPECTIVE PLANTINGS FOR 1941. IT BRINGS UP TO DATE THE 1941 OUTLOOK FOR WHEAT WHICH WAS ISSUED LAST OCTOBER.

ALL WHEAT: ACREAGE, YIELD, AND PRODUCTION,
UNITED STATES, 1919-41

THE ACREAGE SEEDED TO WHEAT FOR HARVEST IN 1941 IN THE UNITED STATES IS INDICATED AT 63 MILLION ACRES, OR ABOUT 1 MILLION ACRES MORE THAN IN 1940. A DECREASE IN PROSPECTIVE SPRING WHEAT ACREAGE OFFSETS A PART OF THE INCREASE IN WINTER WHEAT SEEDINGS. THE TOTAL ACREAGE INDICATED FOR HARVEST IN 1941 IS 4 MILLION ACRES LESS THAN THE 20-YEAR AVERAGE (1921-40). ON THE BASIS OF THE DECEMBER INDICATION OF 633 MILLION BUSHEL OF WINTER WHEAT AND AVERAGE YIELDS PER ACRE ON PROSPECTIVE SPRING WHEAT ACREAGE, A TOTAL CROP OF ABOUT 810 MILLION BUSHEL FOR 1941 IS INDICATED.

673
150
813

THE WHEAT SITUATION

Summary

The domestic wheat supply in 1941-42 is expected to total approximately 1,200 million bushels. This total is based on a winter wheat crop indicated as of December 1, 1940 at about 633 million bushels, a spring wheat crop (including durum) tentatively placed at about 180 million bushels on the basis of average yields on the prospective plantings, and a carry-over on July 1, 1941 estimated at about 380 million bushels. The total domestic supply in 1940-41 was 1,099 million bushels, consisting of a carry-over of 282 million bushels and a crop of 817 million bushels.

On the basis of supplies of 1,200 million bushels and prospects that domestic disappearance will be about 675 million bushels, the quantity available for export, shipments, and carry-over would be about 525 million bushels. It is expected that exports and shipments will be larger than the 30-35 million bushels indicated for the current year.

Although subsoil moisture continues subnormal in the spring wheat area of the Northern Plains, the moisture situation is the best in recent years. Moisture conditions in the Pacific Northwest are very favorable. There is no clear indication at this time of any change in total winter wheat prospects from those indicated in December. The next report by the Crop Reporting Board on winter wheat, issued April 10, will show indicated April 1 yield per seeded acre and indicated production.

Prospects at present are for a world wheat crop in 1941 not greatly different from that in 1940. Much, however, will depend upon developments in Canada, where a new Government program calls for a large reduction in this year's wheat crop. On the other hand, some increase is expected in Europe and

Australia over last year's small outturns. At present little change is expected in the United States, and a small reduction is probable in Argentina.

Wheat prices in the United States are expected to continue to average relatively high compared with prices in other surplus-producing countries as long as the Government loan and export subsidy programs are continued. A loan on the new crop, however, is dependent upon a favorable vote in the national marketing quota referendum, tentatively announced for May 31. There have been no indications to date that the export subsidy will be discontinued. Large supplies in surplus-producing countries are likely to continue to hold world prices at low levels.

For the month ended March 19 wheat prices, influenced partly by the belief that loan rates on the new crop might be increased, advanced as much as 10 cents per bushel to about the high point for the season to date. Subsequently, prices have declined 1 to 2 cents. Factors which are expected to influence prices in the next few months include any important developments in the foreign situation, changes in crop prospects, and any indications of a fairly definite nature with respect to loans on the new crop.

-- March 25, 1941

OUTLOOK FOR THE 1941 WHEAT CROP

BACKGROUND 1/.- The acreage seeded to wheat for harvest in 1940 in the United States was 62.3 million acres, slightly less than the 63.5 million acres seeded for harvest in 1939. However, the 1939-40 acreages represented a very large reduction from seedings for the 1937 and 1938 crops, when 81.1 and 79.6 million acres, respectively, were seeded -- the largest in the history of the country (table 8).

World wheat acreage 2/ reached a peak in 1938. The acreage for the 1939 and 1940 crops was moderately smaller, reflecting the reduction in the United States acreage (tables 11 and 12).

1/ See also background statements on pages 7 and 9.

2/ All references to world acreage, yield, production, and stocks in this report exclude Soviet Russia and China.

World production 2/ for a number of years preceding 1938 did not increase with the upward trend in acreage, however, because of small yields per acre. In 1938-40 yields per acre were very high and some of the largest world crops in history were produced. In both 1938 and 1939 production exceeded consumption, and the world carry-over stocks 2/ on July 1, 1940 were the largest in history (table 7).

Indicated 1941 seeded acres up 2 percent;
crop probably about the same

On the basis of the March 1 reports from growers 3/ regarding their acreage plans for the 1941 season, an area of 17.1 million acres is now indicated for seeding to spring wheat (table 9). This acreage would be 8 percent smaller than the 18.5 million acres seeded last spring and 21 percent below the 10-year (1930-39) average of 21.8 million acres. The seeded acreage in prospect for 1941 is the lowest of any year since 1924, except for the slightly smaller acreage seeded in 1939.

The decrease in spring wheat offsets part of the increase in winter wheat seedings. The acreage seeded to winter wheat for harvest in 1940 was estimated by the Crop Reporting Board in December at 46.3 million acres, which was an increase of 5.3 percent over the acreage a year earlier, when sown acreage was small because of severe drought conditions. Seedings last fall were carried out under the most favorable moisture conditions in many years. The acreage seeded to both spring and winter wheat, totaling 63.4 4/ million acres (table 8), is 1 million acres (2 percent) more than was seeded a year earlier, but 3.7 million acres less than the 20-year (1921-40) average.

Most of the decrease in prospective spring wheat seedings is in the Pacific Northwest and the Northern Rocky Mountain States. Of the 1,410,000-acre decrease in prospective seedings of spring wheat for the entire country, 1,123,000 acres were in the four States of Washington, Oregon, Montana, and Colorado. Moisture conditions at seeding time last fall were favorable to encourage a maximum shift from spring to fall seeding in the parts of those States where such shifts frequently occur, and general observations indicate that the loss of acreage from winter damage up to March 1 is small. A considerable decline in durum acreage is indicated, which may be a reaction to relatively lower returns from this class of wheat.

The decrease in spring wheat acreage for the three Pacific Northwest States totals 636,000 acres, while the four principal hard red spring States show a decrease of only 74,000 acres (table 10). The decrease for Colorado, Nebraska, and Wyoming taken together was 187,000 acres.

2/ All references to world acreage, yield, production, and stocks in this report exclude Soviet Russia and China.

3/ The March reports on "Prospective Plantings" appear to provide a fairly accurate picture of the plans of farmers at this time and show the changes that may be expected in areas where plans are not upset by subsequent weather conditions, changes in prices, or other conditions which cannot be foreseen.

4/ See The Wheat Situation for December 1940, pages 6-7 for detail on winter wheat seedings.

Of the total spring wheat acreage indicated for 1941, 2.9 million acres are durum wheat, and 14.2 million acres are other spring wheat, compared with 3.4 million acres of durum and 15.1 million acres of other spring wheat seeded last year. The prospective acreage of durum wheat is 86 percent of the 10-year (1930-39) average, and that of other spring wheat is 78 percent of average.

If the abandonment of spring wheat is about the same as the average of the years 1930 to 1939, excluding the 2 abnormal years 1934 and 1936, the acreage of spring wheat for harvest in 1941 would be: Durum wheat 2,583,000 acres, other spring wheat 11,925,000 acres, and all spring wheat 14,508,000 acres. If the abandonment of winter wheat acreages is about the same as indicated in the Board's December 1940 report, the total wheat acreage for harvest in 1941 would be approximately 55,709,000 acres. The acreage of all wheat harvested in 1940 was 53,503,000 acres, and the 10-year average 55,884,000 acres.

If growers seed to spring wheat the acreage indicated in the prospective plantings report (17.1 million acres), and if the 20-year (1921-40) average yields (10.4 bushels) are obtained, this year's spring wheat crop including durum will be about 178 million bushels. ^{5/} A winter wheat production of 633 million bushels was indicated in December on the basis of past relationship between December 1 condition and yield per seeded acre with some allowance for the probable effect of weather conditions during the past summer and fall. These two figures together total 811 million bushels.

While subsoil moisture continues subnormal over much of the spring wheat area of the Northern Plains, the moisture situation is the best in recent years. Moisture conditions in the Pacific Northwest are very favorable. There is no clear indication at this time of any change in total winter wheat prospects from those indicated in December. The next report by the Crop Reporting Board will be issued April 10, and will show April 1 yield per seeded acre and indicated production for winter wheat.

Insect injury to the 1941 crop ^{6/} is expected to be somewhat above average, as was the case last year. Prospective grasshopper infestation in the central and northern Great Plains ranges from threatening to severe, but considerably less than that of last year. The control campaign prevented about 65 percent of the grasshopper damage in prospect last year, and plans are being made for effective control operations in 1941. The reduction in potential grasshopper infestation in the 1941 crop is offset by a higher prospective damage by hessian fly and chinch bug. Moderate to severe infestations of hessian fly are indicated for central and eastern Kansas and southeastern Nebraska. Scattered infestations may also occur in Missouri and Iowa but no serious injury from this insect is expected east of the Mississippi River. Heavy to severe chinch bug infestation is indicated for central Indiana, Illinois, Iowa, eastern Nebraska, Kansas, northeastern Oklahoma, and

^{5/} Not to be interpreted as an estimate or forecast. The Crop Reporting Board will indicate a probable range in spring wheat production in its report on June 10 and will issue its first estimate on July 10.

^{6/} Statement furnished by Bureau of Entomology and Plant Quarantine, Division of Cereal and Forage Insect Investigations.

southwestern Missouri. The actual loss due to all three insects will depend largely on spring and early summer weather.

July 1, 1941 carry-over expected to show
increase of about 100 million bushels

The carry-over of old wheat July 1, 1941 is expected to be about 380 million bushels, approximately 100 million bushels more than that of a year earlier. If the 1941 crop turns out to be about 810 million bushels, total supplies would be close to 1,200 million bushels, as compared with 1,099 million bushels in 1940 and 1,003 million bushels in 1939. With the prospects that domestic disappearance will be about 675 million bushels, the quantity available for exports, shipments, and carry-over may be about 525 million bushels. Shipments to possessions are usually about 3 million bushels. It is expected that exports in 1941-42 will be larger than in 1940-41, when they will amount to about 30 million bushels, excluding wheat milled in bond.

World wheat crop prospects about
same as in 1940

Prospects at present are for a world wheat crop in 1941 not greatly different from that of last year. Much, however, will depend upon developments in Canada, where a new Government program calls for a large reduction in this year's wheat crop. On the other hand, some increase is expected in Europe and Australia over last year's small outturns. At present little change is expected in the United States, and a small reduction is probable in Argentina.

While winter wheat acreage in most sections in Europe is considered to have been generally maintained and in a few countries increased, yields are expected to be affected in many cases by shortages of farm labor, draft power, and fertilizer. With around normal weather conditions, an outturn above last year's short crop could be reasonably expected, but very favorable growing and harvesting conditions would be necessary to secure an average or better-than-average crop. In the Danubian countries, despite some pessimistic crop reports during the past 2 months, the crop could still be average if favorable growing conditions prevailed this spring. Latest reports indicate that the acreage seeded to wheat last fall was smaller than was believed earlier, especially in Hungary, and it is still doubtful whether or not a significant increase in the spring wheat plantings can be made. In western Europe and in the western Mediterranean Basin countries present prospects are for a wheat crop ranging from below-average to only average, though generally above last year's harvests. In the British Isles the winter has been severe, but with expanded fall seedings and prospects that spring plantings will be increased by plowing additional land, some further crop gains are expected to be made.

Fall seedings in Canada were reported as 555,000 acres, which represents a substantial reduction from the 774,000 acres seeded a year earlier. In the U.S.S.R. a full winter wheat acreage is reported. The wheat crop outlook in India is reported as promising. The crop is maturing in good condition and harvesting has started. The second official wheat report of acreage seeded put the acreage at 33,368,000 acres, as compared with the second estimate for 1940 of 33,660,000 acres. In Argentina and Australia soil preparations are proceeding satisfactorily.

Domestic prices in 1941-42 expected to continue above
export levels if the loan program is continued

Wheat prices in the United States are expected to continue to average relatively high compared with prices in other surplus-producing countries as long as the Government loan and export subsidy programs are continued. A loan on the new crop, however, is dependent upon a favorable vote in the national marketing quota referendum, tentatively announced for May 31 -7/. In the event that the quota is disapproved, the law specifies that no Government loans can be made on the crop. There have been no indications to date that the export subsidy will be discontinued.

THE DOMESTIC WHEAT SITUATION

BACKGROUND.- In the 10-year period 1930-39 the carry-over of old wheat in the United States averaged about 230 million bushels, and domestic disappearance about 695 million bushels.

Domestic wheat prices from the spring of 1933 to the spring of 1937 were unusually high in relation to world prices as the result of small crops in the United States. In 1937 United States production was large and prices declined. In 1938, with domestic production again large, with a record world crop, and with lower commodity prices generally, prices again declined, and would have averaged still lower had it not been for the loan and export-subsidy programs which held domestic prices above export parity.

Prices received by growers for wheat during the year beginning July 1939, averaging 69 cents, continued relatively high compared with the usual relationship to prices in other countries, as a result of only a moderately large carry-over, reduced acreage, poor prospects for 1940 yields, and holding of wheat in expectation of high prices.

Prices advanced sharply in September 1939, following the outbreak of the European war, and again in December, influenced by war developments and by poor crop prospects in Argentina and the United States. In the middle of May 1940, following the turn of events in Europe, selling became heavy and most of the gains were lost. From the middle of May until the middle of August prices declined seasonally, then they advanced until the middle of November. After two downswings, they have again risen, and are now almost as high as any time during the season.

Exports of wheat, including flour from the United States
in 1940-41 may total about 30 million bushels;
July 1941 carry-over about 380 million bushels

It now appears that exports of United States wheat, including flour, in 1940-41 may total about 30 million bushels, excluding wheat milled in bond.

7/ See The Wheat Situation, February 1941, page 7.

Exports of wheat and flour to date probably total about 26 million bushels. Shipments to United States possessions will total about 3 million bushels. If the figure for exports and shipments in the distribution table (table 1) is adjusted to allow for this new export figure, a change in July 1, 1941 stocks from 385 to 381 is indicated. Table 6 shows United States supply and distribution from 1923 to 1940.

Domestic wheat prices at about high for the season

For the month ended March 19, wheat prices advanced as much as 10 cents per bushel to about the high point for the season to date. This advance was influenced in part by rumors that loan rates on the new crop might be increased. Subsequently, prices have declined 1 to 2 cents.

The amount that current prices are now above export price levels is indicated by the export indemnity which would be required to export wheat to Europe. Computed on the basis of export values, this would be about 25 cents from the Gulf and 21 cents from Pacific ports, compared with about 22 cents a month ago. Prices of domestic spring wheat at Buffalo are about 15 cents lower than those of Canadian wheat of a comparable quality, c.i.f., duty paid at Buffalo.

1079
305
7-12
6/1

Factors which are expected to influence prices in the next few months include any important developments in the foreign situation, changes in crop prospects, and any indications of a fairly definite nature with respect to loans on the new crop. The fact that the Government stands ready to take delivery of loan wheat will continue to place a floor under prices. While every effort is being made to guard against market congestion in any distribution of loan wheat before the new crop comes to market or in connection with the marketing of the new crop, the development of congestion at localized points could tend to offset the influence of the loan program in certain areas.

THE WORLD WHEAT SITUATION

BACKGROUND.- Total world supplies of wheat ^{8/} increased sharply from 1924 to 1933, largely as a result of increased acreage (table 12). From 1934 to 1936, world supplies declined, following successive years of small yields and increased world demand. Supplies increased slightly in 1937. With above-average yields on the large acreage, supplies in 1938 and 1939 were the largest on record.

^{8/} All references to world acreage, yield, production, and stocks in this report exclude Soviet Russia and China.

World wheat prices (table 12) declined in the period 1924-33 with the increase in world supplies. The sharp decline in prices after 1929 was caused largely by the general decline in industrial activity and commodity prices. From the spring of 1933 to the summer of 1937, world wheat prices moved upward, reflecting world-wide recovery in commodity price levels, currency depreciation, and reduced production. The world price for the 1937 crop remained practically unchanged from that of a year earlier. In 1938, world prices again declined sharply as a result of record world production and weakness in demand. Prices in 1939-40 remained low but averaged higher than a year earlier, influenced by general expectations of increased demand for wheat as a result of the war, and by poor crop prospects in Argentina and the United States. In 1940-41 large supplies in surplus countries and reduced trade held prices to low levels.

World carry-over July 1941 expected to be
about same as record last July

As pointed out in previous issues, information has been greatly limited by war conditions, and it has been necessary to fill in the gaps as best as possible. The carry-over and production figures for 1940-41, accordingly, are to be interpreted as indications rather than as conclusions based on official estimates. While there is little basis upon which to forecast the 1940-41 world disappearance or the carry-over next July, it would appear that the crop of 1940, placed at 4,066 million bushels, would about equal the disappearance. This would indicate a carry-over next July of about the same size as in July 1940, when an all-time record was reached. While the disappearance of wheat has been curtailed in European countries, there is evidence that it has been increased in some other countries. Surplus stocks are largely concentrated in Canada, the United States, and Argentina.

Table 3 shows revised estimated world supply and disappearance for 1938 and 1939 and supply for 1940.

Table 3.- Estimated world supply and distribution, year beginning July 1, 1938-39

^{3/} Balancing item.

Surplus large in Canada and Argentina

The estimated wheat surplus for export or carry-over for Canada, Australia, and Argentina, shown in table 4, totals about 903 million bushels, compared with 659 million bushels a year earlier, 523 million bushels in March 1939, and 246 million bushels in March 1938. The Canadian surplus at 650 million bushels exceeds the estimated current world trade of perhaps 450 million bushels by about 50 percent. It is large enough to take care of the entire import requirements of England for about 3 years. While the surplus in Australia is small as a result of the short crop harvested in December, that for Argentina is sizeable.

Table 4.-- Estimated wheat surplus for export or carry-over for three exporting countries, March 1, 1938-41 1/

Any United States buyer of Canadian grain would be required to make settlement in terms of United States dollars through an agent of the Canadian Foreign Exchange Control Board at the official rate. 2/ March futures. 3/ Jan. 4-Mar. 15, 1941 and corresponding dates 1940. 4/ March and May, 1940; April and May 1941.

Canada announces new wheat program to limit 1941 Government purchases 9/

The Canadian wheat program for the 1941 crop, as outlined recently in the House of Commons, calls for a limit on purchases by the Wheat Board and the establishment of an agricultural adjustment program. The Government will guarantee payment for 230 million bushels at the prices prevailing for 1940 wheat (70 cents 10/ minimum Canadian money, or 63 cents United States, basis Fort William or Port Arthur), delivered according to quotas based on 65 percent of the acreage sown for 1940, and will pay storage only on any undelivered portion of the 230 million bushels. These are the outstanding features of the new policy directed toward solving the problem of heavy surplus wheat production in Canada.

The limit set for deliveries to the Wheat Board, 230 million bushels, is equal to about half of the indicated deliveries of wheat from the large crops of the past 2 years. Though it is indicated that farmers will not be compelled to reduce their acreage, they are urged to keep before them an

9/ From Foreign Crops and Markets for March 24, 1941.

10/ The average price to growers in 1940-41 is estimated at 50 cents in Canadian money, or 45 cents in United States currency.

objective of not more than 65 percent of last year's seedings, which is the basis of the market quotas. In order to maintain western farm income and also assist in bringing about an acreage adjustment, the Government proposes to pay the farmer a bonus on the acreage diverted from wheat, provided it is used in certain specified ways.

Wheat acreage left to summer fallow will draw a bonus of \$4 per acre on July 1, 1941, or as soon as possible thereafter. If feed grains or rye are sown on areas diverted from wheat, the bonus will be \$2 per acre. If such acreage is sown to grass or clover, the payment will be \$2, with an additional \$2 if the land is still seeded to the same crop on July 1, 1942. All these acreage bonuses are to apply to the Prairie Provinces only, leaving the winter-sown acreage of Canada unaffected.

The 1941 program includes the continuance of the processing tax on flour for home consumption unchanged. Collections from this tax go into the general fund of the Wheat Board. Up to September 3, 1940, such revenue was reported to have totaled nearly 3 million dollars.

In connection with the quota system of deliveries, it was stated that the first quota will be a general one, allowing each farmer to dispose of the same amount per seeded acre. Subsequent deliveries will be certain proportions of the 1941 yield at the farmer's shipping point; a high-yield point will be permitted a larger quota than a low-yield point.

The Government has arranged, it was announced, with western elevator companies for the construction of new temporary storage facilities to care for 50 million bushels of wheat at Fort William and Port Arthur. A large part of the space thus provided will be available by July 31, and the remainder by August and September. The companies undertaking this work will be allowed to write off, as depreciation for income tax purposes, 50 percent of the cost of the new buildings.

Wheat: Supply and distribution in continental United States, 1923-40

1/ 1923 to 1926 Bradstreet's, excluding country elevator stocks.
 2/ Stocks in merchant mills and elevators - 1923 and 1924 estimated in absence of actual figures; 1925-40, Bureau of Census figures raised to represent all merchant mills. Stored for others - 1923-29, estimated in absence of actual figures; 1930-40, Bureau of Census figures raised to represent all merchant mills.
 3/ From reports of Foreign and Domestic Commerce of the United States. Imports include full-duty wheat, wheat paying a duty of 10 percent ad valorem, and dutiable flour in terms of wheat; and exclude flour free for export as follows: 42,742 bushels in 1936-36; 108,095 bushels in 1937-38; 363,263 bushels in 1938-39; and 213,930, 1939-40. Exports include only flour made from domestic wheat; 1923-35 estimated on basis of total exports less wheat imported for milling in bond and export adjusted for changes in carry-over; beginning 1935, figures for exports and shipments of flour wholly from United States wheat.
 4/ Includes durum wheat returned from Montreal, estimated at 1,500,000 bushels.
 5/ For 1937 excludes new wheat estimated at 12,500,000 bushels; for 1938 excludes 13,423,000 bushels; for 1939, 23,975,000 bushels; and for 1940, 10,314,000 bushels reported as new wheat by Bureau of Census.
 6/ Shipments are to Alaska, Hawaii, Puerto Rico, and Virgin Islands prior to December 31, 1934, included with domestic exports.
 7/ Balancing item.
 8/ For individual items, see supply section of this table.

Estimated world total excluding the U.S.S.R., China, and Manchuria	289,000	293,000	274,000	

Compiled from official data. Seeded acreage for United States and Argentina.

^{1/} Data are in many instances unofficial forecasts and should be interpreted as preliminary indications only.

^{2/} Includes Austria, Sudetenland, and Memelland.

^{3/} Estimate of area not included with Germany and Hungary.

^{4/} Because of changes in boundaries not strictly comparable with other years.

^{5/} Ceded territories included.

^{6/} Includes estimates for some countries besides those listed. Northern Hemisphere excludes the U.S.S.R., China, and Manchuria.

Table 12.-- Estimated world acreage, yield and production, (excluding Soviet Russia and China), 1923-40

Year of harvest 1/	Acreage 2/	Yield per acre	Production
	Million acres	Bushels	Million bushels
1923	236	15.0	3,535

1940 <u>3/</u>	296(282)	311	92	136	835(821)

Compiled as follows:

United States - Stocks on farms, in country mills and elevators, commercial, in merchant mills and elevators, and stored for others by merchant mills.
() = all new wheat excluded.

Canada - 1922 - 1923, carry-over August 31, plus net exports and estimated retention of flour during July and August. 1924 to date, carry-over July 31, plus net exports and estimated retention of flour for July.

Argentina - Carry-over on December 31, plus exports and estimated domestic consumption, July 1 to December 31.

Australia - 1922 - 1924, exports only plus estimated domestic consumption, July 1 to December 31. 1925 to date, carry-over on December 1, plus net exports and estimated domestic consumption, July 1 to November 30.

- 1/ Includes United States wheat in Canada.
2/ Includes Canadian wheat in United States.
3/ Preliminary.

Table 14.- United States domestic exports of wheat by specified countries, semi-annually, beginning July 1937
